# **Particle Measuring System** for Air and Gases

Clean room technology cannot manage without particle measurement technology for monitoring facilities. On the one hand a multitude of contamination sensitive technologies in the electronics industry, in the pharmaceutical industry, in the medical sector, in research and development as well as to an increasing extent in areas of the manufacturing industry have to meet the stringent requirements of manufacturing under clean conditions.

On the other hand security aspects in pharmaceuticals and medicine are of great importance, e.g. the manufacturing and handling of Cytostatica.

For all these areas of application measurements with air particle counters are an essential part of the quality assurance measures for testing the sound condition of filters. Mandatory directives for the inspection of clean areas include: VDI 2083, US Federal Standard 209 E, DIN EN ISO 14644, DIN 1946, DIN 12950 / 12980 as well as the FDA and GMP guidelines.

Various sensors measure particle sizes from 0.1-2000 µm

### **ABAKUS MOBIL AIR**

Particle counter for air and gases

The particle counter Abakus mobil air is an evaluation system for the measurement of number and size of particles in air and in gaseous types of media. The measuring system is suitable for stationary as well as mobile applications. The variable equipment using four different particle sensors (LHS 128, LHS 228, LDS 328, LDS 328s or LDS 528) enables the particle counter to cover the measuring range from 0.1 µm to 50 µm, with the sensor LDS 2/2 5 μm to 500 μm, thus being suitable for a wide range of measuring tasks. The easy to use menu navigation ensures efficient working right from the outset. During the measurement the LCD display provides an overview of 16 particle size channels, date, time and the number of the current measurement. There is a tabular representation of the measuring results. At the end of a measurement the data can be printed out via a thermo printer. The software "Log and Show" allows further processing of the measured results on the PC in various programs

(MS-Excel, Lotus 1-2-3 etc). Direct measuring and filing is also possible via the software. The autocalibration function of the particle counter allows simple testing and secondary calibration of the system.

The particle counter Abakus mobil air is available in two versions: mains-operated version 230V/AC

 version with rechargeable battery 24V/DC / power supply

#### Areas of application:

The monitoring and inspection of cleanrooms, clean workbenches, isolators, filter facilities in surgery rooms, compressed air, filling stations in the pharmaceutical industry, efficiency testing filters, measuring cleanliness of surfaces, etc.

# **PCSS AIR**

Particle counter with 2 channels for monitoring air cleanliness

The PCSS is designed as two-channel particle counter and is used for the monitoring of two size classes. A mini control (SPS) allows controlling of measurements and reading of status information. The measuring result (number particles per channel) can be transmitted to a SPS, a central computer or an electronic logger or further processing.

Since the PCSS can only make time-driven measurements, it is important that there is a controlled flow through the sensor. The PCSS air has a 28.3 l/min. built-in pump. The parameters for flush, measuring and interval time can be set individually for a measurement cycle. During the interval phase the laser of the sensor is switched off in order to boost service life. Each analogue output of the two channels can be allocated a target value and/or maximum value (particle number) (e.g. 20 mA = 2000 particles). The measured number of particles per channel is proportional to current (4-20 mA).

For permanent monitoring of the sensor its laser current and the function of the electronics is evaluated by the on-board diagnosis and in the event of fault the current signals of both channels are set to "zero" —> 0 mA.

Areas of Application:

Online monitoring of isolators and laminar flows for the manufacturing of active

**Recommended loggers:** lumo Logscreen es Jokogawa DAQSTATION

### TCC-PSS AIR

Particle counter with 3 channels for monitoring air cleanliness

The particle counter TCC-PSS air is a monitoring system for online measurement of the number and size of particles in the air. The measuring system is suitable for stationary use and covers with its various sensors a measuring range of 0.2 µm up to 500 µm. Depending on the sensor in use, the TCC can monitor within this range three freely selectable size classes and transmit the particle number either as analogue signal (current e.g. 4-20 mA) to a SPS or to the RS232. For each channel it is possible to set threshold values which monitor the degree of contamination and release an alarm signal if required. The measuring mode of the TCC is for timedriven measurements only which means that the rate of flow through the laser sensor must be kept constant (flow controller or similar). In connection with the PSS air box the air is drawn in by a piston pump through the measuring senor. For compressed air and gases a pressure reducer is used.

#### **Areas of application:**

Monitoring of air cleanliness in hospitals, pharmaceuticals, cosmetics and foodstuff industry, where there are stringent requirements for the ambient air and air conditioning. Use in the semi-conductor industry, printed circuit board manufacturing and micro-mechanical production. in the automobile industry, in safety engineering and in nano technology. For monitoring flush processes in pipelines and containers as well as compressed air and pressure gas.

**Accessories:** Measuring software SW-TCC Parameter software SW-Para

### IMPAKTOR FH5

Universal air sampler for control of microbiological air quality

The air sampler is a measuring instrument for testing the bioburden of the air. which can be used for both the impaction method as well as the filtration method. During the measuring procedure the air is drawn in by a radial fan specifically developed for the FH5 and the flow ist automatically kept constant (impeller anemometer). The electronics control the measurement cycle. The sample volume selected via menu key flows in a defined measuring time through the filter attachment or via the Petri dish with the culture

In the event of insufficient air flow the device switches off and the display shows Düse zu (nozzle blocked) or Filter verblockt (filter blocked) with the filtration method. In addition, the failure triggers a triple audio signal. In the event of too high air flow rate (device open, no nozzle inserted, filter torn, no filter inserted) the device switches off likewise and the message Schlitz offen (slot open) or Filter defekt (filter defect) is displayed.

A fully charged battery allows at least 90 consecutive measurements of 5 min. each.

#### Areas of application:

Hospitals, pharmaceutical, cosmetics and foodstuff industry. Here there are stringent requirements for the bioburden of the ambient air and air conditioning. Bioburden emissions of waste sites. sewage plants and irrigation fields are increasingly attracting attention.

The aerosol generator ATM 225 is used

## **VS 100**

Aerosol Generator ATM 225 Dilution system VS 100

> The dilution system VS 100 is for the defined dilution of aerosols and thus provides the possibility to conduct particle measurements even in the case of very high particle concentrations. This is done by splitting the sample volume flow into 2 partial flows whereby 99% of the actual sample volume flow is directed through a HEPA filter that absorbs virtually all particles contained in the aerosol. This means that only 0.0283 l/min. or o of CEM of the sample volume is fed unfiltered to the particle counter resulting in a dilution ratio of 1:100.

#### Areas of application:

Adjustment of the aerosol generator to a defined particle concentration. Measurement of heavily contaminated rooms and environments.
